Answered February 3, 2016 · Author has 110 answers and 167.7K answer views. Well, I would recommend Einstein and his Inflatable Universe by Dr. Mike Goldsmith, which describes Einstein's life and his contributions towards physics. It also explains weird concepts in a simpler way, such as relativity, time dilation, the unchanging speed of light, etc.

~~What are some good books on astrophysics for a 12 year old~~

Albert Einstein and his Inflatable Universe (2001) - Dr Mike Goldsmith (Albert Einstein) Al Capone and his Gang (1999) - Alan MacDonald Alexander the Great and his Claim to Fame (2005) - Phil Robins (Alexander the Great) Boadicea and her Barmy Army (2005) - Valerie Wilding Churchill and his great Wars (2004) - Alan MacDonald (Winston Churchill) Cleopatra and Her Asp (2000) - Margaret Simpson

Yes, even though he's dead, Al's still full of surprises. You can get the mind-blowing inside story with Albert's lost notebook, read the earth-shattering headlines in The News of the Universe, and find out about the theories that changed the entire cosmos - without making your brain hurt.

Everybody knows that Albert Einstein was the smartest scientist in the universe and that he also had some very bad hair days. But in this Horribly Famous title readers can find out everything they didn't know, including how Albert was actually expelled from school, and how he was spied on by the Nazis and the FBI. With Albert's lost notebook readers can at last get inside his super-brain, and in 'The News of the Universe' they can get to grips with all his amazing theories without making their brains hurt!

You've probably heard of a few scientists... - Galileo Galilei and his telescope - Isaac Newton and his apple - Charles Darwin and his theory of evolution. But have you heard that... - Galileo was sentenced to life in prison for his shocking ideas about the solar system - Newton wasn't all that keen on science - sometimes it got on his nerves - Darwin wrote a book about his pet worms? Yes, even though they're dead, scientists are still full of surprises - and the nine in this book are more surprising than most. Now you can get the inside story from their lost notebooks, read the news reports as their breakthroughs hit the headlines, and find out all about the mind-blowing experiments! Dead Funny ~ Dead Gripping ~ Dead Famous

A NEW YORK TIMES NOTABLE BOOK OF 2020 NAMED A BEST BOOK OF THE YEAR BY * THE WASHINGTON POST * THE ECONOMIST * NEW SCIENTIST * PUBLISHERS WEEKLY * THE GUARDIAN From one of the most dynamic rising stars in astrophysics, an “engrossing, elegant” (The New York Times) look at five ways the universe could end, and the mind-blowing lessons each scenario reveals about the most important concepts in cosmology. We know the universe had a beginning. With the Big Bang, it expanded from a state of unimaginable density to an all-encompassing cosmic fireball to a simmering fluid of matter and energy, laying down the seeds for everything from black holes to one rocky planet orbiting a star near the edge of a spiral galaxy that happened to develop life as we know it. But what happens to the universe at the end of the story? And what does it mean for us now? Dr. Katie Mack has been contemplating these questions since she was a young student, when her astronomy professor informed her the universe could end at any moment, in an instant. This revelation set her on the path toward theoretical astrophysics. Now, with lively wit and humor, she takes us on a mind-bending tour through five of the cosmos’s possible finales: the Big Crunch, Heat Death, the Big Rip, Vacuum Decay (the one that could happen at any moment!), and the Bounce. Guiding us through cutting-edge science and major concepts in quantum mechanics, cosmology, string theory, and much more, The End of Everything is a wildly fun, surprisingly upbeat ride to the farthest reaches of all that we know.

The essential beginner's guide to string theory The Little Book of String Theory offers a short, accessible, and entertaining introduction to one of the most talked-about areas of physics today. String theory has been called the "theory of everything." It seeks to describe all the fundamental forces of nature. It encompasses gravity and quantum mechanics in one unifying theory. But it is unproven and fraught with controversy. After reading this book, you'll be able to draw your own conclusions about string theory. Steve Gubser begins by explaining Einstein's famous equation $E = mc^2$, quantum mechanics, and black holes. He then gives readers a crash course in string theory and the core ideas behind it. In plain English and with a minimum of mathematics, Gubser covers strings, branes, string dualities, extra dimensions, curved spacetime, quantum fluctuations, symmetry, and supersymmetry. He describes efforts to link string theory to experimental physics and uses analogies that nonscientists can understand. How does Chopin's Fantasie-Improptu relate to quantum mechanics? What would it be like to fall into a black hole? Why is dancing a waltz similar to contemplating a string duality? Find out in the pages of this book. The Little Book of String Theory is the essential, most up-to-date beginner's guide to this elegant, multidimensional field of physics.

INSTANT NEW YORK TIMES BESTSELLER "Provocative and thrilling ... Loeb asks us to think big and to expect the unexpected." —Alan Lightman, New York Times bestselling author of Einstein's Dreams and Searching for Stars on an Island in Maine Harvard's top astronomer lays out his controversial theory that our solar system was recently visited by advanced alien technology from a distant star. In late 2017, scientists at a Hawaiian observatory glimpsed an object soaring through our inner solar system, moving so quickly that it could only have come from another star. Avi Loeb, Harvard's top astronomer, showed it was not an asteroid; it was moving too fast along a strange orbit, and left no trail of gas or debris in its wake. There was only one conceivable explanation: the object was a piece of advanced technology created by a distant alien civilization. In Extraterrestrial, Loeb takes readers inside the thrilling story of the first interstellar visitor to be spotted in our solar system. He outlines his controversial theory and its profound implications: for science, for religion, and for the future of our species and our planet. A mind-bending journey through the furthest reaches of science, space-time, and the human imagination, Extraterrestrial challenges readers to aim for the stars—and to think critically about what’s out there, no matter how strange it seems.

Everybody knows Tutankhamun was a Pharaoh with an-over-the top burial mask who went to an early grave. But did you know that he was the leader of the world's number-one superpower at nine years old and he married his own sister? Everything you ever wanted to know about the boy with the cursed tomb with all the grisly bits left in.

Even though they're dead, the great inventors in this book are still full of surprises! Everybody thinks that Thomas Edison invented the light bulb and that John Logie Baird's TV took the world by storm. But in this Horribly Famous title, readers will discover that Edison didn't invent the first light bulb (although he invented a thousand other things) and that Baird's TV was useless.
