We can determine the concentration of salt in the tank by dividing $x(t)$ by the volume of the solution, which remains constant, 50 L, because the flow rate in is the same as the flow rate out. Therefore, the concentration of salt at time t is $x(t)/50$ kg/L and output rate = $x(t)/50$ (kg/L) \cdot 6(L/min) = $3x(t)/25$ (kg/min).
