4.1. The changes of agricultural landscape pattern and their driving forces. The change of landscape structure greatly depends on the political, economic technological and demographic changes (Jelescek, 1984). As expected, with changes of the land use policy, the structural adjustment of the agricultural sector, the initiation of Chinese Family Planning and implementation of large-scale eco-environment conservation programmes, especially the execution of the integral soil erosion control ...

It also depicts the changes in the cropping patterns in the state during four periods of time, i.e. 1995–2000, 2000–2005, 2005–2010 and 2010–2015. The trends of growth in area, production and yields of all major crops including the individual crops were computed for the period of 1995–1996 to 2014–2015 by applying the Least Square Growth formula.

In 1982, agricultural land use dominated in both of the two study areas, but the area under cultivation had decreased by 1997. The changing pattern in the northwest study area was one of phased transition towards, a more urban land use. In contrast, in the southeast study area, there was a sudden.

Development of specific agricultural land use patterns and livelihood strategies is affected by farm households' characteristics as well as exogenous factors. This study, based on a survey of 210 households in Kanchanaburi Province of Thailand, applied a stepwise multiple regression technique to analyze the factors influencing agricultural land use patterns and livelihoods.

An analysis of factors affecting agricultural land use

Through the above table it shows that the changes in agricultural land-use pattern in Nashik District, compared the land-use data of 2000-2001 to 2010-2011 (Table-1) Area put to non- agricultural use,Cultivable waste,Other fallow, Net sown area, Area sown more than once all these showed increasing trends.

If we extend our land coverage above from arable land use to total agricultural land (which is the sum of arable, permanent crops and pastures and meadows), we still see overall declines in land per person but with different rates and patterns of reduction. Overall, we see that agricultural land per person is higher than that of arable land.

Land Use - Our World in Data

Global warming affects agriculture in a number of ways, including through changes in average temperatures, rainfall, and climate extremes (e.g., heat waves); changes in pests and diseases; changes in atmospheric carbon dioxide and ground-level ozone concentrations; changes in the nutritional quality of some foods; and changes in sea level.

Results of the study revealed that, in case of land utilization pattern, forest area retained its share of 71.5 per cent and lost remaining 28.5 per cent to agriculture land (1 3.6 %), cultivable waste land (7.70%), fallow land (2.80 %). Cultivable waste land lost its share to land not available for cultivation (54.60 %) and forest (45.40 %).

Food may become more expensive as climate change mitigation efforts increase energy prices. Water required for food production may become more scarce due to increased crop water use and drought. Competition for land may increase as certain areas become climatically unsuitable for production.

Our results are related with the change of the role of agricultural land over time. Abstract. This paper investigates the effects of agricultural land on rural-urban migration and the labor market outcomes in the context of China. We employ the rural sample of the 2009 RUMIC data, which cover approximately 8000 rural households in 82 counties ...

Agriculture provides nearly half of the world's employment. Now a day, incredible varieties of methods and technologies are used to maximize the agricultural production. Agriculture is the main pillar of economy to the developing countries. The present work entitled "Changes in Agricultural Land Use" is my own work. This dissertation has been written in simple, lucid, clear and modern style So that the teachers and students of Agriculture and Geography could draw maximum benefit. The use of tables and diagrams are given for the better understanding of the subject matters.

The patterns of land use that have evolved in Europe reflect the boundaries set by the natural environment and socio-economic responses to the needs of the population. Over the centuries man has been able to overcome increasingly the constraints placed on land use by the natural environment through the development of new technologies and innovations, driven by an increasing population and rising material expectations. However, activities are still ultimately constrained by natural limitations such as climatic characteristics and associated edaphic and vegetational features. A major problem for land management, in its broadest sense, can be a reluctance to foresee the consequent ecological changes. This means that mitigating strategies will not be implemented in time to prevent environmental degradation and social hardship, although in many parts of Europe, over some centuries, demands have been met in a sustainable way, by sound, prudent and temperate expectations that have dictated management regimes. The management of land in Europe has always been a complex challenge: land is the primary, though finite resource. Decisions regarding the use of land and manipulation of ecosystem dynamics today may affect the long-term primary productivity of the resource. Decisions to change land use may be virtually irreversible: urbanization is an illustration of the influence of population density on the land resource.

This valuable book summarizes recent research by experts from both the natural and social sciences on the effects of population growth on land use. It is a useful introduction to a field in which little quantitative research has been conducted and in which there is a great deal of public controversy. The book includes case studies of African, Asian, and Latin American countries that demonstrate the varied effects of population growth on land use. Several general chapters address the following timely questions: What is meant by land use change? Why are ecological research and population studies so different? What are the implications for sustainable growth in agricultural production? Although much work remains to be done in quantifying the causal connections between demographic and land use changes, this book provides important insights into those connections, and it should stimulate more work in this area.

Interactions between agriculture, climate and patterns of land use are complex. Major changes in agriculture, and land use patterns are foreseen in the next couple of decades in response to shifts in climate, greenhouse gas management initiatives, population growth and other forces. The book explores key interactions between changes in agriculture, patterns of land use and efforts to reduce greenhouse emissions from agriculture. The volume is based on inter-disciplinary science and policy interactions, exploring the way land use may aid in addressing or be affected by the onset of climate change and alterations in food demand. Future forces shaping land use decisions are examined, and its sensitivity to climate change is highlighted. Patterns of land use and the agricultural role in climate change mitigation are explored. Also, policy and social responses to the new perspectives on future land use patterns are identified. The perspective of the book is beyond the year 2015.

This book, which is the result of a painstaking but humble research work, aspires to provide the reader an in-depth insight into its thrust area, namely a socio-economic study on the changing pattern of productivity of agricultural land in the district of Burdwan, West Bengal, India in the context of Indian agriculture. It attempts to focus on some hitherto uncharted aspects and areas of the subject-matter and issues it addresses. In a world which, among other things, is preoccupied with the concern for providing itself with food essential for its existence, the author humbly hopes that his work will open up new avenues of thought that will lead to new methods and means for solving this crisis which threatens to further complicate our lives in the years to come. This book is imperative to the researchers as well as post graduate students and common readers.

As the world's population exceeds an incredible 6 billion people, governments and scientists everywhere are concerned about the prospects for sustainable development. The science academies of the three most populous countries have joined forces in an unprecedented effort to understand the linkage between population growth and land-use change, and its implications for the future. By examining six sites ranging from agricultural to intensely urban to areas in transition, the multinational study panel asks how population growth and consumption directly cause land-use change, and explore the general nature of the forces driving the transformations. Growing Populations, Changing Landscapes explains how disparate government policies with unintended consequences and globalization effects that link local land-use changes to consumption patterns and labor policies in distant countries can be far more influential than simple numerical population increases. Recognizing the importance of these linkages can be a significant step toward more effective environmental management.
