This biannual offers detailed coverage of the regulations, requirements, and techniques for the validation of processes and systems used in regulated international industries. It addresses significant requirements for pharmaceutical, medical device, and biologic companies as well as environmental laboratories. It examines Good Manufacturing Principles (GMPs), Good Clinical Practices (GCPs), Good Laboratory Practices (GLPs), Good Automated Library Practices (GALPs), and others, and elucidates up-to-the-minute industry changes and international concerns.

The "functional" in the title of this book not only reflects my personal bias about neuroanatomy in brain research, it is also the gist of many chapters which describe sophisticated ways to resolve structures and interpret them as dynamic entities. Examples are: the visualization of functionally identified brain areas or neurons by activity staining or intracellular dye-iontophoresis; the

resolution of synaptic connections between physiologically identified nerve cells; and the biochemical identification of specific neurons (their peptides and transmitters) by histo- and immunocytochemistry. I personally view the nervous system as an organ whose parts, continuously exchanging messages, arrive at their decisions by the cooperative phenomenon of consensus and debate. This view is, admittedly, based on my own experience of looking at myriads of nerve cells and their connections rather than studying animal behaviour or theorizing. Numerous structural studies have demonstrated that interneurons in the brain must receive hundreds of thousands of synapses. Many neurons receive inputs from several different sensory areas: each input conveys a message about the external world and possibly also about past events which are stored within the central nervous system. Whether an interneuron responds to a certain combination of inputs may be, literally, a matter of debate whose outcome is decided at the post synaptic membrane. A nerve cell responding to an overriding command is possibly a rare event.

Since natural languages exist in two different modalities - the visual-gestural modality of sign languages and the auditory-oral modality of spoken languages - it is obvious that all fields of research in modern linguistics will benefit from research on sign languages. Although previous studies have provided important insights into a wide range of phenomena of sign languages, there are still many aspects of sign languages that have not yet been investigated thoroughly. The structure of subordinated clauses is a case in point. The study of these complex syntactic structures in the visual-gestural modality adds to our understanding of linguistic variation in the domain of subordination. Moreover, it offers new empirical and theoretical evidence concerning possible structures and functions of subordination in natural languages. And last but not least, it answers the question to what extent the corresponding morphosyntactic and prosodic strategies depend on the modality of articulation and perception. This volume represents the first collection of papers by leading experts in the field investigating topics that go beyond the analysis of simple clauses. It thus contributes in innovative ways to recent debates about syntax, prosody, semantics, discourse structure, and information structure and their complex interrelation.

PCMag.com is a leading authority on technology, delivering Labs-based, independent reviews of the latest products and services. Our expert industry analysis and practical solutions help you make better buying decisions and get more from technology.
