Page 1 of 10. Question 1. (6 points) A

priority queue is a data structure that supports storing a set of values, each of which has an associated key. Each key-value pair is an entry in the priority queue. The basic operations on a priority queue are:

- `insert(k, v)` – insert value `v` with key `k` into the priority queue
- `removeMin()` – return and remove from the priority queue the entry with the smallest key.

CSE 373 Final Exam 3/14/06 Sample Solution
Solutions. Be warned that old courses might have covered different material and used different policies for exams. For example, at least the following were changed in Spring 2009: quicksort uses the first element as the partition element; shellsort uses a different increment sequence; red-black BSTs are left-leaning 2-3 trees; KMP and grep implementations are completely different; and LZW uses a different starting code.

There has been an explosive growth in the field of combinatorial algorithms. These algorithms depend not only on results in combinatorics and especially in graph theory, but also on the development of new data structures and new techniques for analyzing algorithms. Four classical problems in network optimization are covered in detail, including a development of the data structures they use and an analysis of their running time. Data Structures and Network Algorithms attempts to provide the reader with both a practical understanding of the
